

MENU HELP

=====

The HELP facilities are *not* intended to provide help with the substance of logic. They are intended to provide help with the features of the program. The program itself, however, provides fairly thorough explanations of substantive logic errors. You can search this document to FIND a particular word or phrase by pressing Ctrl+F.

Use the Module buttons to select one of the six modules to begin your work. The module windows are all resizable, and can be placed anywhere on your desktop.

You can open more than one instance of each module. For example, if, while working on a derivation exercise, you need to prove a theorem that will justify a rule you wish to use, you can simply open a second, separate instance of the Derivations module in which to prove the theorem while keeping the original derivation open in the original window.

Each of the modules has a button to return to this Menu. Return to the Menu to:

- 1 Open another module or instance of a module.
- 2 Access selected documents, including "Using Logic 2010".
- 3 Access your Assignments page (containing new assignments, and a report on the work you have submitted).
- 4 Access the Course Website.
- 5 Revise the e-mail address you provided with your User Information.
- 6 Backup your "Logic" work-folder to the database.
- 7 Copy your work-folder from your hard disk to a diskette or vice versa.
- 8 Quit the program (you will be asked if you wish to save any unsaved work).

BACKUP TO THE DATABASE. A simple method for backing up your "Logic" work-folder is to backup to the database. Before you quit the program, click "Backup" on the Menu. You will be required to select the course, and to enter your logic password. Your work will be backed up over the Internet to the logic database. This could take up to a minute, so be patient.

If you have backed up in this manner, and you wish to restore your work to your hard disk or to a diskette: First, using "Delete Work/Quit" or some other method, delete or rename any files in your current "Logic" work-folder at the location (hard disk or diskette) to which you wish to restore your work. The Restore function will not overwrite existing files, so in order to restore, you must first delete the work in your "Logic" work-folder. You can easily delete the files from your current work-folder by opening the program to the appropriate location, using either LogicHrd.bat or LogicFlp.bat, and then clicking "Delete Work/Quit" on the main Menu. The next time you open the program to that location you will be queried on whether you wish to Create a new disk or Restore your backup files. Select

“Restore”, and you can choose any of your last three Backups to be written to the disk. Again, this could take up to a minute. You will need your Student ID and your logic password to restore.

Always Backup your work, and always try to begin with a “Logic” work-folder containing all your previous work so that any new work is simply added to your previous work in the same folder. If you start a new work-folder not containing your previous work, there will be no way to meld any work you save to the new folder with your previous work. The program cannot meld the work in distinct work-folders. You can only restore a complete “Logic” work-folder.

COPY “LOGIC” WORK-FOLDER. You can copy your “Logic” work-folder from your hard disk to your floppy diskette by starting the program with LogicHrd.bat and clicking on "Copy". You can copy your work from your floppy diskette to your hard disk by starting the program with LogicFlp.bat and clicking on "Copy". The Copy function is useful as an alternative (or supplement) to backing up to the database. Some students who work both at home and in a computer lab prefer to carry a complete version of their work on a floppy diskette rather than trust the Internet Backup and Restore operations.

TWO WAYS TO QUIT. Ordinarily, you would quit the program simply by clicking “Quit”. However, there are two circumstances in which you should use the alternative “Delete Work/Quit”. First, as described above, you may wish to use “Delete Work/Quit” in preparing to restore a previously backed up “Logic” work-folder. Second, use “Delete Work/Quit” when you have stored your work on the hard disk in a computer lab. This will clean up your work-folder so that the next person will not be inconvenienced.

Bug notice: In this, as in the other modules, a bug in the underlying JAVA language sometimes causes the window to first appear as an all gray screen. Anything that causes the window to be redrawn will usually remedy the problem. The easiest method is to double-click the title bar to maximize the window, and then to double-click it again to restore it to normal size. An analogous problem sometimes causes windows to be sticky, that is, for pieces of them to remain when they should be cleared away. Again, as with the Gray Screen bug, anything that causes the window to be redrawn will usually remedy the problem.
